อิเล็กทรอนิกส์ทางการศึกษา

บริษัท บัค โปรโมชั่น แอนด์ เซอร์วิส จำกัด

Introduction

BioOne เป็นฐานข้อมูลที่รวบรวมวารสารอิเล็กทรอนิกส์ประมาณ **167** รายชื่อ จากสำนักพิมพ์ที่มีชื่อเสียงมากกว่า **125** สำนักพิมพ์ ทางสาขาวิชาชีววิทยา (Biological) นิเวศวิทยา (Ecological) วิทยาศาสตร์สิ่งแวดล้อม (Environmental Sciences) และสาขาที่เกี่ยวข้อง ให้ข้อมูลย้อนหลังตั้งแต่ปี **1998** – ปัจจุบัน ประกอบด้วยรายการทางบรรณานุกรม สารสังเขป และเอกสารฉบับเต็มรูปแบบ **HTML** และ **PDF**

Abstract

Proteolytic activities are essential for follicular growth, ovulation, as well as for luteal formation and regression. Using suppression subtractive hybridization (SSH), a novel mouse ovary-selective gene (termed protease serine 35, *Prss35*) was identified. Analysis of the mouse genome database using the *Prss35* sequence led to the identification of a homologous protease (protease serine 23, *Prss23*). PRSS35 possesses general features that are characteristic of serine (Ser) proteases, but is unique in that the canonical Ser that defines this enzyme family is replaced by a threonine (Thr). In contrast,

ABSTRACT

Proteolytic activities are essential for follicular growth, ovulation, as well as for luteal formation and regression. Using suppression subtractive hybridization (SSH), a novel mouse ovary-selective gene (termed protease serine 35, *Prss35*) was identified. Analysis of the mouse genome database using the *Prss35* sequence led to the identification of a homologous protease (protease serine 23, *Prss23*). PRSS35 possesses general features that are characteristic of serine (Ser) proteases, but is unique in that the canonical Ser that defines this enzyme family is replaced by a threonine (Thr). In contrast, PRSS23 possesses the standard catalytic Ser typical for this family of proteases. As determined by real-time polymerase chain reaction (PCR), the *Prss35* mRNA levels increased around the time of ovulation and remained elevated in the developing corpus luteum. Steroid ablation/replacement studies demonstrated progesterone-dependent regulation of *Prss35* gene expression prior to follicle rupture. *Prss35* gene expression was localized to the theca cells of pre-antral follicles, the theca and granulosa cells of pre-

INTRODUCTION

Proteases comprise a group of structurally and functionally diverse proteins that catalyze the hydrolysis of peptide bonds. The highly selective and limited cleavage of specific protein substrates by the five major groups of proteases (serine-, metallo-, aspartic-, cysteine-, and threonine-proteases) are critical for a number of essential biological processes [1]. For example, proteases remodel extracellular matrix (ECM) proteins, modulate growth factor/cytokine actions by regulating their bioavailability, and control the levels of certain cell surface/receptor proteins. Therefore, proteases are critical determinants of cellular proliferation, differentiation, migration, and adhesion. As such, enzymatic proteolysis is indispensable for maintaining homeostasis, tissue remodeling, and angiogenesis or angiolytic [2, 3]. The recent completion of several large-scale genome sequencing projects and the development of high-throughput differential screening methodologies have led to the identification of hundreds of mouse
